# Coprime Integer Encryption Algorithm Upon Euler’s Totient Function’s Unsolved Problems 

Remzi Aktay<br>Kecioren Sehit Halil Isilar Middle School

#### Abstract

For the natural number $n>1$, Euler function gives the amount of natural numbers smaller than and coprime to n. However, there is no study to find out what these numbers are. In this study, the solution method of this problem which the Euler Function cannot respond to has been found. In this method, Groups, Cyclic Groups, Group Homomorphism and Group Isomorphism are used. In addition, Modular Arithmetic and Chinese Remainder Theorem were used. Thanks to the method found, at least two-levels encryption algorithm has been developed. In this algorithm, it is aimed to prevent related companies from backing up, especially in social media and various communication applications such as WhatsApp.

Keywords: Abstract Algebra, Algorithm, Chinese Remainder Theorem, Cyclic Group, Group Isomorphism

## 1. Introduction

For the natural number $n>1$,
$n=a^{\mathrm{x}} \cdot \mathrm{b}^{\mathrm{y}} \cdot \mathrm{c}^{\mathrm{z}} \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots . . . \ldots$ is number $n$ 's prime factorization;
$\phi(n)=\left(\mathrm{a}^{\mathrm{x}}-\mathrm{a}^{\mathrm{x}-1}\right) \cdot\left(\mathrm{b}^{\mathrm{y}}-\mathrm{b}^{\mathrm{y}-1}\right) \cdot\left(\mathrm{c}^{\mathrm{z}}-\mathrm{c}^{\mathrm{z}-1}\right) \ldots \ldots \ldots \ldots \ldots .$. value is found by the formula.

- When n is prime number; $\phi(n)=n-1$
- When n is the odd natural number; $\phi(2 n)=\phi(n)$
- When n is an even natural number; $\phi(2 n)=2 . \phi(n)$
- When $n=2^{\mathrm{k}}, \mathrm{k} \in \mathrm{Z}^{+} ; \phi(\mathrm{n})=\frac{n}{2}$

Euler function gives the amount of natural numbers smaller than and coprime integer to $n$. There is
no study on the values of these numbers. This problem, which the Euler function cannot answer, is emphasized. In order to find these numbers, firstly; the generators of two isomorphic groups were acted on. Later in the study for three or more isomorphic groups; An encryption algorithm was tried to be developed based on its generators. ${ }^{1}$

## 2. Method

### 2.1 Group and Group Types

In the $(\mathrm{G}, \Delta)$ binary operation, the transaction that satisfies the following conditions specifies a group.
For $\forall \mathrm{a}, \mathrm{b} \in \mathrm{G}$; $\mathrm{a} \Delta \mathrm{b} \in \mathrm{G}$ expression, that is, the closure property must be provided.

- For $\forall a \in G$, it must be $e \in G$, which provides $a \Delta e=e \Delta a=a$, and this element is called a neutral (unit) element.
- The element $a^{-1} \in G$ that provides " $a \Delta a^{-1}=a^{-1} \Delta a=e$ " for $\forall a \in G$ is the inverse element.
- For $\forall \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{G} ;(\mathrm{a} \Delta \mathrm{b}) \Delta \mathrm{c}=\mathrm{a} \Delta(\mathrm{b} \Delta \mathrm{c})$ associative property must be provided. Binary operations that provide these features are called abelian groups. ${ }^{2}$

### 2.1.1 $\quad Z_{n}$ Total Groups

The (Z,+) Total group is a group under addition process defined in integers.
$\left(Z_{n},+\right)$ Total group is the group that accepts the remainder class of the number $n$.
The set $\mathrm{Z}_{7}=\{\overline{0}, \overline{1}, \overline{2}, \overline{3}, \overline{4}, \overline{5}, \overline{6}\}$ is the group formed under the addition process.

### 2.1.2 Cartesian Product Groups

$\left(\mathrm{Z}_{\mathrm{n}} \mathrm{X} \mathrm{Z} \mathrm{Z}_{\mathrm{m}},{ }^{+}\right)$group is the additive group that accepts the Cartesian product of $\mathrm{Z}_{\mathrm{n}}=\{\overline{0}, \overline{1}, \overline{2}, \ldots \ldots \ldots, \overline{n-1}\}$ and $\mathrm{Z}_{\mathrm{m}}=\{\overline{0}, \overline{1}, \overline{2}, \ldots \ldots \ldots, \overline{m-1}\}$ sets. Similarly, the Cartesian Product group can be written eternally as $\mathrm{Z}_{\mathrm{n}} \mathrm{X}_{\mathrm{m}} \mathrm{X}_{\mathrm{p}}, \mathrm{Z}_{\mathrm{n}} \mathrm{X} \mathrm{Z}_{\mathrm{m}} \mathrm{X} \mathrm{Z}_{\mathrm{p}} \mathrm{X} \mathrm{Z}_{\mathrm{t} . . .}$.

### 2.1.3 Cyclic Groups

In group ( $\mathrm{G}, *$ ), it is called the group that satisfies the condition of $\langle\bar{a}\rangle$ including $₫ a \in G$. The elements " $a$ " in this group are called generators. If a group is cyclic, it must be an abelian group.

### 2.2 Group Homomorphism

Let $(\mathrm{G}, \Delta)$ and $(\mathrm{H}, *)$ be two groups.
$f: G \rightarrow H, f$ function, $f: H \rightarrow G$
$\forall \mathrm{a}, \mathrm{b} \in \mathrm{G}$; If $f(\mathrm{a} \Delta \mathrm{b})=f(\mathrm{a}) * f(\mathrm{~b})$ satisfies the condition, it is called group homomorphism.

- If the $f$ function is the Overlying Function; It is called epimorphism.
- If the domain and image set are the same, the $f$ function is called atomorphism.
- If $f$ function is injective and onto function; called isomorphism.

### 2.2.1 Group Isomorphism

For the isomorphism defined as $f: G \rightarrow H$, the following can be said;

- The G and H groups either both of the groups are cyclic groups or none are.
- Both groups must be either abelian groups or non-abelian groups.
- The order of the two groups must be the same.
- Both groups must be either countable groups or uncountable groups.

### 2.3 Properties of two isomorphic and cyclic groups

Let $(\mathrm{G}, \Delta)$ and $(\mathrm{H}, *)$ be two cyclic groups. If these two groups are isomorphic, the number of generators of both groups is the same. In addition, the generators in both groups match exactly.

## $2.4 \mathrm{Z}_{\mathrm{n}}$ and $\mathrm{Z}_{\mathrm{m}} \mathrm{X} \mathrm{Z}_{\mathrm{p}}$ Cyclic-Isomorph Groups

Numbers that are smaller than n and coprime numbers to n , are actually generators of the $\mathrm{Z}_{\mathrm{n}}$ group. If we find an isomorph $Z_{m} X Z_{p}$ group to the $Z_{n}$ group, we can analyze the relation between its generators.

Example1: $\mathrm{Z}_{6}$ and $\mathrm{Z}_{2} \mathrm{X} \mathrm{Z}_{3}$ groups are isomorphic to each other. Let's create the group table of both groups.

| $\mathrm{Z}_{6}$ | $\overline{1}$ | $\overline{2}$ | $\overline{3}$ | $\overline{4}$ | $\overline{5}$ | $\overline{0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\overline{1}$ | $\overline{2}$ | $\overline{3}$ | $\overline{4}$ | $\overline{5}$ | $\overline{0}$ | $\overline{1}$ |
| $\overline{2}$ | $\overline{3}$ | $\overline{4}$ | $\overline{5}$ | $\overline{0}$ | $\overline{1}$ | $\overline{2}$ |
| $\overline{3}$ | $\overline{4}$ | $\overline{5}$ | $\overline{0}$ | $\overline{1}$ | $\overline{2}$ | $\overline{3}$ |
| $\overline{4}$ | $\overline{5}$ | $\overline{0}$ | $\overline{1}$ | $\overline{2}$ | $\overline{3}$ | $\overline{4}$ |
| $\overline{5}$ | $\overline{0}$ | $\overline{1}$ | $\overline{2}$ | $\overline{3}$ | $\overline{4}$ | $\overline{5}$ |
| $\overline{0}$ | $\overline{1}$ | $\overline{2}$ | $\overline{3}$ | $\overline{4}$ | $\overline{5}$ | $\overline{0}$ |

(Table-1)

| $\mathrm{Z}_{2} \mathrm{XZ}$ | $(\overline{1}, \overline{1})$ | $(\overline{0}, \overline{2})$ | $(\overline{1}, \overline{0})$ | $(\overline{0}, \overline{1})$ | $(\overline{1}, \overline{2})$ | $(\overline{0}, \overline{0})$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(\overline{1}, \overline{1})$ | $(\overline{0}, \overline{2})$ | $(\overline{1}, \overline{0})$ | $(\overline{0}, \overline{1})$ | $(\overline{1}, \overline{2})$ | $(\overline{0}, \overline{0})$ | $(\overline{1}, \overline{1})$ |
| $(\overline{0}, \overline{2})$ | $(\overline{1}, \overline{0})$ | $(\overline{0}, \overline{1})$ | $(\overline{1}, \overline{2})$ | $(\overline{0}, \overline{0})$ | $(\overline{1}, \overline{1})$ | $(\overline{0}, \overline{2})$ |
| $(\overline{1}, \overline{0})$ | $(\overline{0}, \overline{1})$ | $(\overline{1}, \overline{2})$ | $(\overline{0}, \overline{0})$ | $(\overline{1}, \overline{1})$ | $(\overline{0}, \overline{2})$ | $(\overline{1}, \overline{0})$ |
| $(\overline{0}, \overline{1})$ | $(\overline{1}, \overline{2})$ | $(\overline{0}, \overline{0})$ | $(\overline{1}, \overline{1})$ | $(\overline{0}, \overline{2})$ | $(\overline{1}, \overline{0})$ | $(\overline{0}, \overline{1})$ |
| $(\overline{1}, \overline{2})$ | $(\overline{0}, \overline{0})$ | $(\overline{1}, \overline{1})$ | $(\overline{0}, \overline{2})$ | $(\overline{1}, \overline{0})$ | $(\overline{0}, \overline{1})$ | $(\overline{1}, \overline{2})$ |
| $(\overline{0}, \overline{0})$ | $(\overline{1}, \overline{1})$ | $(\overline{0}, \overline{2})$ | $(\overline{1}, \overline{0})$ | $(\overline{0}, \overline{1})$ | $(\overline{1}, \overline{2})$ | $(\overline{0}, \overline{0})$ |

(Table-2)

When two group tables are examined,

- In the top row, the generators are in the same place and match one each.
- The positions of the generators in the group tables are the same and match exactly.

### 2.5 Finding $\mathrm{Z}_{\mathrm{n}}$ Generator from Cartesian Product Group generator

Let there be two isomorphic groups. We can find the generator in the $\mathrm{Z}_{\mathrm{n}}$ group of a generator taken from the cartesian product group.

Example2: Let's find a number coprime to and smaller than 60 .
Solution2: $\mathrm{Z}_{60}$ group and $\mathrm{Z}_{4} \mathrm{X}_{15}$ group are isomorphic to each other. Let's get a generator from the group $\mathrm{Z}_{4} \mathrm{X}_{15}$. Generator (3,7) is actually the generator that is formed in the group table $\mathrm{Z} 4 \mathrm{X} \mathrm{Z15}$ by summing the number $(1,1) \mathrm{n}$ times.
n. $(\overline{1}, \overline{1}) \equiv(\overline{3}, \overline{7})(\bmod (4,15))$

$$
\begin{array}{rl}
(\mathrm{n}, \mathrm{n}) \equiv(\overline{3}, \overline{7})(\bmod (4,15)) \Rightarrow n & n 3(\bmod 4) \\
n & \equiv 7(\bmod 15)
\end{array}
$$

$$
\begin{align*}
& \mathrm{n} \equiv \overline{3}(\bmod 4) \Rightarrow n=4 k+3, k \\
& \begin{aligned}
\mathrm{n} \equiv \overline{7}(\bmod 15) \Rightarrow n=4 k+3 & \equiv 7(\bmod 15) \\
& \Rightarrow 4 k \equiv 4(\bmod 15) \\
& \Rightarrow k \equiv 1(\bmod 15) \\
& \Rightarrow k=15 m+1, m \in Z
\end{aligned}
\end{align*}
$$

If (1) in (2) is written in place;
It is $n=4 k+3=4(15 \mathrm{~m}+1)+3=60 \mathrm{~m}+7$.
Example3: Let's find a number coprime to and smaller than 120.
Solution3: The group isomorphic to the $\mathrm{Z}_{120}$ group is $\mathrm{Z}_{3} \mathrm{X}_{5} \mathrm{X}_{8}$.
Let's take a generator from the cartesian product group. Let this generator $(\overline{2}, \overline{3}, \overline{7})$.
$n .(\overline{1}, \overline{1}, \overline{1}) \equiv(\overline{2}, \overline{3}, \overline{7})(\bmod (3,5,8))$
$\mathrm{n} \equiv 2(\bmod 3)$
$\mathrm{n} \equiv 3(\bmod 5)$
It is $\mathrm{n} \equiv 7(\bmod 8)$.
$\mathrm{n} \equiv 2(\bmod 3) \Rightarrow n=3 k+2, k \in Z$.

$$
\begin{align*}
3 k+2 \equiv 3(\bmod 5) & \Rightarrow 3 k \equiv 1(\bmod 5)  \tag{3}\\
& \Rightarrow k \equiv 2(\bmod 5)
\end{align*}
$$

$$
\begin{equation*}
\Rightarrow k=5 t+2, t \in Z \tag{4}
\end{equation*}
$$

If (3) in (4) is written in place;

$$
\begin{align*}
& n=3(5 t+2)+2=15 t+8 \\
& \begin{aligned}
n=15 t+8 \equiv 7(\bmod 8) & \Rightarrow 15 t \equiv-1(\bmod 8) \\
& \Rightarrow-t \equiv-1(\bmod 8) \\
& \Rightarrow t \equiv 1(\bmod 8) \\
& \Rightarrow t=8 m+1, m \in Z
\end{aligned}
\end{align*}
$$

It is $n=15(8 t+1)+8=120 t+23$. In $\mathrm{Z}_{120}$; 23 was found as generator. 23 and 120 are coprime numbers.

## 3. Results

Numbers, which smaller than $n>1$ natural number and coprime to $n$; if $Z_{n}$ group and $Z_{m} X Z_{p} X Z_{t}$ Cartesian product group is isomorphic to each other, it can be found easily with the help of generators. It can also be written as a function.

Example 4: Let $\mathrm{Z}_{\mathrm{n}}$ group and $\mathrm{Z}_{\mathrm{m}} \mathrm{X} \mathrm{Z}_{\mathrm{p}} \mathrm{X} \mathrm{Z}_{\mathrm{t}}$ group be isomorphic groups. Taken from the cartesian product group $(\bar{y}, \bar{z}, \bar{r})$; for all generators,

$$
f(x)=\left\{\begin{array}{c}
x \equiv y(\bmod m) \\
x \equiv z(\bmod p) \\
x \equiv r(\bmod t)
\end{array}\right.
$$

The function $f(x)$ is the function that gives the coprime to and smaller than n .

### 3.2 Reaching Zn group from cartesian product groups

$\mathrm{n}=$ p.q.r.m.t.x.y,
Let $\mathrm{Z}_{\mathrm{p}} \mathrm{X} \mathrm{Z}_{\mathrm{q}} \mathrm{X} \mathrm{Z}_{\mathrm{r}} \mathrm{X} \mathrm{Z}_{\mathrm{m}} \mathrm{X} \mathrm{Z}_{\mathrm{t}} \mathrm{X} \mathrm{Z}_{\mathrm{x}} \mathrm{X} \mathrm{Z}_{\mathrm{y}}$ Cartesian product be an isomorph to the $\mathrm{Z}_{\mathrm{n}}$ group. For the generator $(\bar{a}, \bar{b}, \bar{c}, \bar{d}, \bar{e}, \bar{f}, \bar{g})$ taken from the cartesian product group,

The generator can find in the group $\mathrm{Z}_{\mathrm{p} . \mathrm{q}} \mathrm{X} \mathrm{Z}_{\mathrm{r}} \mathrm{X} \mathrm{Z}_{\mathrm{m}} \mathrm{X} \mathrm{Z}_{\mathrm{t}} \mathrm{X} \mathrm{Z}_{\mathrm{x}} X \mathrm{Z}_{\mathrm{y}}$.
The generator can find in the group $\mathrm{Z}_{\mathrm{p.q.r}} \mathrm{X} \mathrm{Z}_{\mathrm{m}} \mathrm{X} \mathrm{Z}_{\mathrm{t}} \mathrm{X} \mathrm{Z}_{\mathrm{x}} \mathrm{X} \mathrm{Z}_{\mathrm{y}}$.
The generator can find in the group $\mathrm{Z}_{\mathrm{p} . \mathrm{q} . \mathrm{r} . \mathrm{m}} \mathrm{X} \mathrm{Z}_{\mathrm{t}} \mathrm{X} \mathrm{Z}_{\mathrm{x}} \mathrm{X} \mathrm{Z}_{\mathrm{y}}$.
The generator can find in the group $Z_{\text {p.q.r.m.t }} X Z_{x} X Z_{y}$.
The generator can find in the group $\mathrm{Z}_{\text {p.q.r.m.t. }} \mathrm{X} \mathrm{Z}_{\mathrm{y}}$.
The generator can find in the group $\mathrm{Z}_{\text {p.q.r.m.t.x.y }}=\mathrm{Z}_{\mathrm{n}}$.
This number gives the numbers coprime to and smaller than $n$.

Coprime Integer Encryption Algorithm Upon Euler＇s Totient Function＇s Unsolved Problems

## 3．3 Creating an Algorithm

This algorithm is primarily prepared at the simplest level．Different forms of this algorithm are described in detail in Section 4．While creating the character code table to be used in this algorithm，ASCII characters are coprime to and smaller than 816；Character table was made by matching from small to large numbers respectively．

（Table－3）
As can be seen in Table－3，while the number 816 is chosen，it is aimed to have 256 coprime numbers．
Because the number of ASCII characters is 256.

### 3.3.1 First encryption with $\mathrm{Z}_{3} \mathrm{X}_{16} \mathrm{X} \mathrm{Z}_{17}$ group

In this encryption, firstly, character codes in Table-3 created according to the generators of the $\mathrm{Z}_{816}$ group that is isomorphic to this group will be used.

Example 5: Let's encrypt the word "Ahmet" in the given group. First of all, the character codes of the letters are as follows; $\mathrm{A}=205, \mathrm{~h}=365, \mathrm{~m}=347$, $\mathrm{e}=319, \mathrm{t}=371$. Since these numbers are generators of the $\mathrm{Z}_{816}$ number, the matching generators in $\mathrm{Z}_{3} \mathrm{X}_{\mathrm{Z}_{16}} \mathrm{X}_{\mathrm{Z}}{ }_{17}$ will be passwords.

- When 205. $(\overline{1}, \overline{1}, \overline{1}) \equiv(\bar{x}, \bar{y}, \bar{z})(\bmod (3,16,17))$ is found, the generator becomes $(1,13,1)$.
- When 365. $(\overline{1}, \overline{1}, \overline{1}) \equiv(\bar{x}, \bar{y}, \bar{z})(\bmod (3,16,17))$ is found, the generator becomes (2.13.8).

When the operations are continued;

| CHARACTER | TEXT ENCRYPTION |
| :---: | :---: |
| $\mathbf{A}$ | $(\mathbf{1 , 1 3 , 1 )}$ |
| $\mathbf{h}$ | $(2,13,8)$ |
| $\mathbf{m}$ | $(2,11,7)$ |
| $\mathbf{e}$ | $(\mathbf{1 , 1 5 , 1 3})$ |
| $\mathbf{t}$ | $(2,3,14)$ |

(Table-4)
It is encrypted in Table-4.
3.3.1.2 decrypting the $\mathrm{Z}_{3} \mathrm{X}_{16} \mathrm{X}_{17}$ group

Each password in Table-4, the generator, has the generator in $\mathrm{Z}_{816}$. The value of this generator makes it possible to find out which character corresponds to from the character code table.

Example-6: Let's find out which character the password in Table-4 $(2,13,8)$ belongs to.
$x \equiv 2(\bmod 3)$
$x \equiv 13(\bmod 16)$
$x \equiv 8(\bmod 17)$.
$x \equiv 2(\bmod 3) \Rightarrow x=3 k+2, k \in Z$

$$
\begin{align*}
x \equiv 13(\bmod 16) & \Rightarrow 3 k+2 \equiv 13(\bmod 16)  \tag{6}\\
& \Rightarrow 3 k \equiv 11(\bmod 16)
\end{align*}
$$

$$
\begin{align*}
& \Rightarrow 3 k \equiv 27(\bmod 16) \\
& \Rightarrow k \equiv 9(\bmod 16) \\
& \quad \Rightarrow k=16 m+9, m \in Z \tag{7}
\end{align*}
$$

If (7) in (6) is written in place;

$$
\begin{gather*}
x=3 .(16 m+9)+2 \\
x=48 m+29 \ldots \tag{8}
\end{gather*}
$$

$x=48 m+29 \equiv 8(\bmod 17)$

$$
\begin{align*}
& \Rightarrow 14 m \equiv-21(\bmod 17) \\
& \Rightarrow-3 m \equiv-21(\bmod 17) \\
& \Rightarrow m \equiv 7(\bmod 17) \\
& \quad \Rightarrow m=17 p+7, p \in Z \tag{9}
\end{align*}
$$

If (9) in (8) is written in place;
$x=48 .(17 p+7)+29$
$x=816 p+365$.
The number 365 becomes the generator in Z816 and is the code of the letter " h " in Table- 3 .

### 3.3.2.1 Second (level) encryption in $\mathrm{Z}_{48} \mathrm{X} \mathrm{Z}_{17}$ group

Character codes received according to the $\mathrm{Z}_{816}$ group are encrypted according to the $\mathrm{Z}_{3} \mathrm{X} \mathrm{Z}_{16} \mathrm{X}$ $\mathrm{Z}_{17}$ group. The encrypted text is encrypted again according to the $\mathrm{Z}_{48} \mathrm{X} \mathrm{Z}_{17}$ group.

Example-7: Let's find the equivalent of the generator $(\overline{2}, \overline{11}, \overline{7})$, which is the encrypted version of the letter " $m$ " in Table-4, to the generator in $\mathrm{Z}_{48} \mathrm{X} \mathrm{Z}_{17}$.

$$
x \equiv 2(\bmod 3)
$$

$$
\begin{equation*}
x \equiv 11(\bmod 16) \tag{10}
\end{equation*}
$$

$x \equiv 2(\bmod 3) \Rightarrow x=3 k+2, k \in Z$
$3 k+2 \equiv 11(\bmod 16)$
$3 k \equiv 9(\bmod 16)$
$k \equiv 3(\bmod 16) \Rightarrow k=16 t+3, t \in Z$.
If (11) in (10) is written in place;
$x=3(16 t+3)+2=48 t+11$.
The number 11 is found as a generator in $\mathrm{Z}_{48}$.
Accordingly, the second encryption is made in the case of $(\overline{2}, \overline{11}, \overline{7}) \rightarrow(\overline{11}, \overline{7})$.

Coprime Integer Encryption Algorithm Upon Euler's Totient Function's Unsolved Problems

| CHARACTER | CHARACTER <br> CODE | Encrypted text according to $Z_{3}$ <br> $\times Z_{16} \times Z_{17}$ | Encrypted text according to <br> $Z_{i s} \times Z_{17}$ |
| :---: | :---: | :---: | :---: |
| A | $\mathbf{2 0 5}$ | $(\mathbf{1 , 1 3 , 1 )}$ | $(13,1)$ |
| h | $\mathbf{3 6 5}$ | $(2,13,8)$ | $(29,8)$ |
| $\mathbf{m}$ | $\mathbf{3 4 7}$ | $(2,11,7)$ | $(11,7)$ |
| e | $\mathbf{3 1 9}$ | $(\mathbf{1 , 1 5 , 1 3 )}$ | $(\mathbf{3 1 , 1 3 )}$ |
| $\mathbf{t}$ | $\mathbf{3 7 1}$ | $(2,3,14)$ | $(35,14)$ |

(Table-5)

### 3.3.2.2 Decryption in $\mathrm{Z}_{48} \mathrm{X} \mathrm{Z}_{17}$ Group

When the text encrypted for the second time in $\mathrm{Z}_{48} \mathrm{X} \mathrm{Z}_{17}$ group is decoded according to $\mathrm{Z}_{816}$, it is decrypted.

Example-8: In Table-5, let's decrypt the encrypted character (31,13).
$x \equiv 31(\bmod 48)$
$x \equiv 13(\bmod 17)$
$x \equiv 31(\bmod 48) \Rightarrow x=48 t+31, t \in Z$
$48 t+13 \equiv 13(\bmod 17)$
$-3 t \equiv-28(\bmod 17)$
$-3 t \equiv-11(\bmod 17)$
$t \equiv \frac{11}{3}(\bmod 17)$
$t \equiv 15(\bmod 17) \Rightarrow t=17 m+15, m \in Z$
If (13) in (12) is written in place;
$x=48(17 m+15)+31=816 m+319$.
The number 319, which is the generator in the $\mathrm{Z}_{816}$ group, is the code of the letter "e" in the character code table.

## 4. Conclusion and Discussion

The following results were reached in this study;

- First of all, the value of coprime numbers to and smaller than n can be found the number n , which the Euler function cannot respond to. The important thing here is that there is an isomorphic cartesian product to the $\mathrm{Z}_{\mathrm{n}}$ group for the number n .
- When an isomorphic, cartesian product group is found to $\mathrm{Z}_{\mathrm{n}}$ group, the function giving the coprime numbers can be created from the generators of the Cartesian product group.

For example; Let $\mathrm{Z}_{\mathrm{n}}$ be an isomorph to $\mathrm{Z}_{\mathrm{m}} \mathrm{X} \mathrm{Z}_{\mathrm{p}} \mathrm{X} \mathrm{Z}_{\mathrm{q}}$ group. The function that gives coprime numbers;

$$
f(x)= \begin{cases}x \equiv a(\bmod m), & (\bar{a}, m)=1 \\ x \equiv b(\bmod p), & (b, p)=1 \\ x \equiv c(\bmod q), & (c, q)=1\end{cases}
$$

The same function can be created with quart or more Cartesian product groups.

- The reasons for taking $\mathrm{Z}_{816}$ group while creating the algorithm can be explained as follows;

1. $\phi(816)=256$, ASCII characters are 256.
2. The $\mathrm{Z}_{816}$ group is isomorphic to the $\mathrm{Z}_{3} \mathrm{X}_{16} \mathrm{X}_{17}$ group, and isomorphic to the $\mathrm{Z}_{48} \mathrm{X}_{17}$ group. Two levels encryption can be done.

- For the whole character of a text in the created algorithm, the generators of the $\mathrm{Z}_{3} \mathrm{X}_{16} \mathrm{X}_{17}$ group are written and the first encryption is made, then the encrypted text is encrypted again in $\mathrm{Z}_{48}$ $\mathrm{X} \mathrm{Z}_{17}$ and sent to the third person.
- Thanks to this encryption, the second person, who is called the intermediary, encrypts it differently without deciphering password and sends it to the receiver. Especially when the software is made, the company, which is an intermediary in applications such as WhatsApp, cannot make backups.
- It is not necessary to take the Zn group as $\mathrm{Z}_{816}$ in this encryption algorithm. A very large number n is chosen such that the Cartesian product group can contain more than three Cartesian products. Here, 256 numbers of $n$ and coprime numbers can be selected and given to ASCII Characters as codes. In this way, more than two encryptions can be made.
