#### Abstract

This paper presents the study of the Algebra of Operators on Algebraic Tensor Products. Here, we consider R additive group of reals with discrete topology constructing $\mathrm{C}^{*}$ - algebras canonically associated with R - along with A and B are $\mathrm{C}^{*}$ - algebras, it is proved in this paper that all $\mathrm{C}^{*}$ - algebras have several distinct $\mathrm{C}^{*}$ - norms on Algebraic tensor product $\mathrm{A} \odot \mathrm{B}$ are mutually distinct.

Keywords: Algebraic Tensor Products, C*-Algebras, W*-Algebras, C*-Tensor Norms, Normal and Binormal Norms, Hilbert Space.

## Introduction

The present work is an attempt towards the generalization of work done by E.G. EFFROS (1) and Kothe (4, 5). In fact, the present area is the extension of work done by Ghosh, H.C. (2), Halub, J.R. (3), Kumar et al. (6), Srivastava et al. (7), Srivastava et al. (8), Srivastava et al. (9) and Tomiyama, J. (10). In this paper, we have studied analytically about Algebra of operators on Algebraic Tensor products.

## Mathematical Treatment of the Problem:

Let, $\mathrm{R}=$ additive group of reals with discrete topology. There are several ways of constructing $\mathrm{c}^{*}$-algebras canonically associated with $R$. For example if $\pi$ is the universal representation of $R$ on the Hilbert space $H$, the group $c^{*}$ - algebra $c^{*}(R)$ is the $c^{*}$ - subalgebra of $\mathcal{L}(H)$ genrated by the set $\{\pi(g): g \in R\}$. The left regular group $c^{*}$ - algebra $c_{\ell}{ }^{*}(R)$ is the $c^{*}$ - subalgebra of $\mathcal{L}\left(\ell^{2}(R)\right)$ generated by $\pi \ell(R)$, $\pi \ell$ being the left regular representation of $R$, when

$$
\pi \ell(\mathrm{g}) \xi(\mathrm{h})=\xi\left(\mathrm{g}^{-1}(\mathrm{~h})\right),\left(\mathrm{g}, \mathrm{~h} \in \mathrm{R}, \xi \in \ell^{2}(\mathrm{R})\right)
$$

The right regular group $\mathrm{C}^{*}$-algebra $\mathrm{C}_{\mathrm{r}}{ }^{*}(\mathrm{R})$ is defined analogously using the right regular representation $\pi_{\mathrm{r}}$ of $R$, when
$\pi_{\mathrm{r}}(\mathrm{g}) \xi(\mathrm{h})=\xi(\mathrm{hg}),\left(\mathrm{g}, \mathrm{h} \in \mathrm{R}, \xi \in \ell^{2}(\mathrm{R})\right)$

By its definition $\pi$ contains $\pi_{\ell}$ and $\pi_{\mathrm{r}}$, and there are natural homomorphism $\lambda_{\ell}$ and $\lambda_{\mathrm{r}}$ of $\mathrm{c}^{*}(\mathrm{R})$ onto $\mathrm{c}_{\ell}{ }^{*}(\mathrm{R})$ and $\mathrm{c}_{\mathrm{r}}{ }^{*}(\mathrm{R})$ resp.
(Note also that the representations $\pi_{\ell}$ and $\pi_{\mathrm{r}}$ are equivalent, so that $\mathrm{c}_{\ell}{ }^{*}(\mathrm{R})$ and $\mathrm{c}_{\mathrm{r}}{ }^{*}(\mathrm{R})$ are in fact isomorphic).

Let A and B be c*-algebras, with algebraic tensor product A $\odot$ B. In general there are several distinct (usually incomplete).
$c^{*}$ - norms on $\mathrm{A} \odot \mathrm{B}$. Two such norms are of particular interest: the maximal norm $v$ of Guichander and the minimal (or spatial) norm $\alpha$ of Turumaru.

If $\pi_{1}$ and $\pi_{2}$ are representations of A and B, respectively, on the Hilbert space $H,\left\{\pi_{1}, \pi_{2}\right\}$ is said to be a committing pair of representations of $\mathrm{A}, \mathrm{B}$ if
$\pi_{1}(\mathrm{a}) \pi_{2}(\mathrm{~b})=\pi_{2}(\mathrm{~b}) \pi_{1}(\mathrm{a}) \quad(\mathrm{a} \in \mathrm{A}, \mathrm{b} \in \mathrm{B})$
The norm $v$ is defined by
$v\left(\mathrm{a}_{\mathrm{i}} \otimes \mathrm{b}_{\mathrm{i}}\right)=\sup \left(\| \|_{\mathrm{i}} \pi_{1}\left(\mathrm{a}_{\mathrm{i}}\right) \pi_{2}\left(\mathrm{~b}_{\mathrm{i}}\right) \|\right)$
the supremum being taken over all commuting pairs of representations of $A, B$. The norm $\alpha$ is defined as follows:
if $\mathrm{x} \in \mathrm{A} \odot \mathrm{B}, \alpha(\mathrm{x})$ is the smallest non-negative real number $\mathcal{R}$ such that
$<\mathrm{f} \otimes \mathrm{g}, \mathrm{a}^{*} \mathrm{x}^{*} \mathrm{xa}>\leq \mathcal{R}^{2}<\mathrm{f} \otimes \mathrm{g}, \mathrm{a} * \mathrm{a}>$
For all $\mathrm{a} \in \mathrm{A} \odot \mathrm{B}$ and all satisfies f and g of A and B respectively. If for all $\mathrm{B} \alpha=v$ on $\mathrm{A} \odot \mathrm{B}, \mathrm{A}$ is said to be nuclear (the terminology in due to Lance, which an introduction to the theory of $\mathrm{c}^{*}$ - tensor product. For a discrete group $R, c_{\ell}{ }^{*}(R)=c^{*}(R)$ iff $G$ is amenable, and this is the case iff $c_{\ell}{ }^{*}(G)$ is nuclear.

Let $R$ be a discrete group and let be the representation of $c^{*}(R) \odot C^{*}(R)$ on $\ell^{2}(R)$ given by
$\lambda\left(\Sigma \mathrm{a}_{\mathrm{i}} \otimes \mathrm{b}_{\mathrm{i}}\right)=\Sigma \lambda_{\mathrm{i}}\left(\mathrm{a}_{\mathrm{i}}\right) \lambda_{\mathrm{r}}\left(\mathrm{b}_{\mathrm{i}}\right)$
It is natural to ask relative to which $c^{*}$ - norms $\eta$ on $c^{*}(R) \odot c^{*}(R), \lambda$ is bounded. If $\eta=\lambda$, is already bounded with $\eta=\alpha$, the same is true if $R$ is amenable (by the remark above). One of the main results of this section is essentially that $R=F_{2}$, the free group on two generators, $\lambda$ is bounded when $\eta=\alpha$. A consequence of this fact is that, even in the separable case, it is not always possible to describe the ideal structure of the spatial tensor product of two $c^{*}$-algebras in terms of the ideal structures of the individual algebras. It follows moreover that the spatial c*- norm is not in general preserved by quotients, (by quotients respect the maximal norm $v$ ).

EFFROS and Lance have recently introduced two new c*- tensor norms, the normal and binormal norms. Let A and B be c*-algebras.

If A is a $\mathrm{W}^{*}$ - algebra, the left normal norm $v_{\ell}$ on $\mathrm{A} \odot \mathrm{B}$ is defined by

$$
v_{\ell}\left(\Sigma \mathrm{a}_{\mathrm{i}} \otimes \mathrm{~b}_{\mathrm{i}}\right)=\sup \left(\left\|\Sigma \pi_{1}\left(\mathrm{a}_{\mathrm{i}}\right) \pi_{2}\left(\mathrm{~b}_{\mathrm{i}}\right)\right\|\right)
$$

the supremum being taken over all commuting pairs of representations $\left\{\pi_{1}, \pi_{2}\right\}$ of $\mathrm{A}, \mathrm{B}$ with $\pi_{1}$ normal. If B is a $\mathrm{W}^{*}$-algebra, the right normal norm $v_{\mathrm{r}}$ is defined analogously with $\pi_{2}$ rather $\pi_{1}$ required to be normal. If $A$ and $B$ are both $W^{*}$-algebras, the binormal norm $\beta$ is given by a similar expression, the supremum being taken this time over all commuting pairs of normal representations of $\mathrm{A}, \mathrm{B}$. The notation and terminology used here follow those of for the most part.

If $A$ and $B$ are $c^{*}$ - algebras and $\eta$ is a $c^{*}$ - norm on $A \odot B$, then $\eta$ - completion of $A \odot B$ will be denoted $A \otimes \eta B$, the $\alpha$ - completion will be denoted simply by $A \otimes B$. If $B$ is a $c^{*}$ - subalgebra of $A$, a linear map $\rho: A \rightarrow B$ is a refraction, if it is a projection of norm 1 , i.e. if $\|\rho\|=1$ and $\rho(\mathrm{x})=\mathrm{x}$ for $\mathrm{x} \in \mathrm{B}$. Finally, all c*- algebras homomorphism and representations will be assumed to be *- preserving.

Now, we discuss the five norms $\alpha, v_{1}, v_{r}, \beta$ and $v$ on $A \circ A$. Latter, we see that these all five norms are mutually distinct. Let A and B be $\mathrm{C}^{*}$ - algebras with algebraic tensor product $\mathrm{A} \odot \mathrm{B}$. In general, there are several distinct (Usually incomplete) C* - norms on A $\circ$ B. Two such norms are of particular interest: the maximal norm $v$ and the minimal (or spatial) norm $\alpha$.

If $\Pi_{1}$ and $\Pi_{2}$ are representations of $A$ and B, respectively, on the Hilbert Space $H,\left\{\Pi_{1}, \Pi_{2}\right\}$ is said to be a commuting pair of representations of $\mathrm{A}, \mathrm{B}$ if

$$
\Pi_{1}(\mathrm{a}) \Pi_{2}(\mathrm{~b})=\Pi_{2}(\mathrm{~b}) \Pi_{1}(\mathrm{a}),(\mathrm{a} \in \mathrm{~A}, \mathrm{~b} \in \mathrm{~B}) .
$$

The norm $v$ is defined by

$$
\underset{\mathrm{i}}{v\left(\sum_{\mathrm{i}} \otimes \mathrm{~b}_{\mathrm{i}}\right)}=\operatorname{Sup}\left(\left\|\underset{\mathrm{i}}{\| \prod_{1}\left(\mathrm{a}_{\mathrm{i}}\right)} \Pi_{2}\left(\mathrm{~b}_{\mathrm{i}}\right)\right\|\right) .
$$

## Main Result

Proposition: $\quad$ Let $A=M \oplus N$; then the five norms $\alpha, v_{1}, v_{r}, \beta$ and $v$ on $\mathrm{A} \circ \mathrm{A}$ are mutually distinct.

## Lemma:

Let $\mathrm{M}_{1}, \mathrm{M}_{2}$ and B be $\mathrm{W}^{*}$ - algebras. Then the canonical isomorphism

Analytical Study of Algebra of Operators on Algebraic Tensor Products

$$
\left(\mathrm{M}_{1} \oplus \mathrm{M}_{2}\right) \odot \mathrm{B} \cong\left(\mathrm{M}_{1} \odot \mathrm{~B}\right) \oplus\left(\mathrm{M}_{2} \odot \mathrm{~B}\right)
$$

extends to an isomorphism of

$$
\left(M_{1} \oplus M_{2}\right) \otimes_{\eta} B \text { onto }\left(M_{1} \otimes_{\eta} B\right) \oplus\left(M_{2} \otimes_{\eta} B\right)
$$

When $\eta$ is any of the above five norms.

## Proof of Lemma:

Let $e$ and $f$ be the identity projections of $M_{1}$ and $M_{2}$, respectively; then, $\mathrm{e}+\mathrm{f}=1$. Let $\left\{\Pi, \Pi^{\prime}\right\}$
be a commuting pair of representations of $M_{1} \oplus M_{2}$, B on the Hilbert Space $H$. $\Pi$ (e) and $\Pi$ (f) commute with $\Pi\left(\mathrm{M}_{1} \oplus \mathrm{M}_{2}\right)$ and $\Pi^{\prime}(\mathrm{B})$, so that

$$
\mathrm{H}_{1}=\Pi(\mathrm{e}) \mathrm{H} \text { and } \mathrm{H}_{2}=\Pi(\mathrm{f}) \mathrm{H}
$$

are invariant subspaces for $\Pi$ and $\Pi^{\prime}$.

Let $\quad \prod_{\mathrm{i}}=\Pi / \mathrm{H}_{\mathrm{i}}, \Pi_{\mathrm{i}}^{\prime}=\Pi^{\prime} / \mathrm{H}_{\mathrm{i}}(\mathrm{i}=1,2)$;
then $\left\{\Pi_{1}, \Pi^{\prime}{ }_{1}\right\}$ and $\left\{\Pi_{2}, \Pi^{\prime}{ }_{2}\right\}$
are commuting pairs of representations of $M_{1} \oplus M_{2}, B$ on $H_{1}$ and $H_{2}$ respectively.

Moreover, $\Pi$ is normal if and only if $\prod_{1}$ and $\prod_{2}$ are ; and for

$$
\begin{aligned}
& \sum \mathrm{x}_{\mathrm{i}} \otimes \mathrm{~b}_{\mathrm{i}} \in \mathrm{M}_{1} \odot \mathrm{~B}, \sum \mathrm{y}_{\mathrm{j}} \otimes \mathrm{c}_{\mathrm{j}} \in \mathrm{M}_{2} \odot \mathrm{~B} \\
& \left\|\sum \Pi\left(\mathrm{x}_{\mathrm{i}}\right) \Pi^{\prime}\left(\mathrm{b}_{\mathrm{i}}\right)+\sum \Pi\left(\mathrm{y}_{\mathrm{j}}\right) \Pi^{\prime}\left(\mathrm{c}_{\mathrm{j}}\right)\right\| \\
& =\max \left(\left\|\sum \prod_{1}\left(\mathrm{x}_{\mathrm{i}}\right) \Pi^{\prime}{ }_{1}\left(\mathrm{~b}_{\mathrm{i}}\right)\right\|,\left\|\sum \prod_{2}\left(\mathrm{y}_{\mathrm{j}}\right) \Pi^{\prime}{ }_{2}\left(\mathrm{c}_{\mathrm{j}}\right)\right\|\right)
\end{aligned}
$$

The Lemma follows easily from this relation and the definitions of the various norms.

## Proof of Proposition:

In view of the lemma it is sufficient to check that any two of the norms $\alpha, v_{1}, v_{r}, \beta$ and $v$ differ on at least one of the algebraic tensor products $\mathrm{M} \odot \mathrm{M}, \mathrm{M} \odot \mathrm{N}$,
$\mathrm{N} \odot \mathrm{M}$ and $\mathrm{N} \odot \mathrm{N}$,

$$
\begin{equation*}
\text { on } \mathrm{M} \odot \mathrm{~N}, \alpha=v_{1}=\beta . \tag{i}
\end{equation*}
$$

In the notation of the homomorphisms

$$
\begin{aligned}
& \mathrm{x}
\end{aligned} \quad \rightarrow \Phi(\mathrm{x}),(\mathrm{x} \in \mathrm{M}),
$$

constitute a commuting pair of representations of $\mathrm{M}, \mathrm{N}$ on $\mathrm{H}(\mathrm{N})$, the second representation being normal. Thus the homomorphism.
$\sum \mathrm{x}^{\mathrm{i}} \otimes \mathrm{y}^{\mathrm{i}} \rightarrow \sum \Phi\left(\mathrm{x}^{\mathrm{i}}\right) \mathrm{R}\left(\tilde{y}^{i}\right) ; \mathrm{M} \odot \mathrm{N} \rightarrow \mathrm{L}(\mathrm{H}(\mathrm{N}))$ is continuous relative to the norm $v_{\mathrm{r}}$ on $\mathrm{M} \odot \mathrm{N}$ and also if it is not continuous relative to $\alpha$, so that $\alpha \neq v_{r} \leq v$ on $M \circ N$.
(ii) In exactly the same way

$$
\alpha=v_{\mathrm{r}}=\beta \neq v_{\mathrm{l}} \leq \mathrm{v} \text { on } \mathrm{N} \odot \mathrm{M} .
$$

(iii) The representation

$$
\sum x_{i} \otimes y_{i} \rightarrow x_{i} R\left(\tilde{y}_{i}\right) \text { of } N \odot N \text { on } H(N)
$$

is clearly continuous relative to the norm $\beta$ on $\mathrm{N} \odot \mathrm{N}$.

Again by the other relevant proposition, this representation is not continuous relative to $\alpha$.
Thus, $\alpha \neq \beta$ on $\mathbf{N} \odot \mathbf{N}$. Thus the proposition is now completed. Hence the result.
